BSc. Data Science And Business Analytics - Semester 6

Design Thinking & Entrepreneurial Mindset

Applying Design Thinking to Solve a Real-World Problem

"VerifyIt" — A WhatsApp Fact-Check Bot to Combat Misinformation

Shashank Kishor Kanade

703

Section 1 : Problem Identification

1.1 What is the Problem?

In today's world, internet access has become available to almost everyone. While this has many benefits, it has also made it extremely easy to create and spread false or unverified information. Platforms like WhatsApp, which are used daily by millions of Indians across all age groups, have become a primary channel for misinformation to spread rapidly.

False messages related to health remedies, government schemes, and political/communal topics are forwarded hundreds of times before anyone questions their authenticity. The problem is not just that fake news exists — it is that ordinary people have no quick, easy, and reliable way to verify information before forwarding it.

Figure: Problem Overview — Key Dimensions of Misinformation on WhatsApp

1.2 Who Faces This Problem?

User Group	How They Are Affected
Older family members (parents, relatives)	Trust forwarded messages and act on them without verifying
Students and young adults	Receive political or exam-related fake news regularly
General WhatsApp users	Forward messages with good intentions but spread misinformation unknowingly
Society/community group members	Receive communal or local fake news creating panic

1.3 When and Where Does It Occur?

This problem occurs daily, inside WhatsApp groups such as family groups, friend groups, society groups, and college groups. It becomes especially dangerous during elections, health crises, or communal tensions when emotions are high and people forward without thinking.

1.4 Why Is It Important?

- Fake health remedies have caused real physical harm to people
- Fake government scheme messages have led to financial fraud
- Political/communal fake news has caused social unrest and panic
- Once a false message spreads, it is nearly impossible to correct

1.5 Personal Context

I have personally received fake news on WhatsApp many times, including false health tips, fake government scheme messages, and political misinformation. People around me, including family members, have believed and forwarded such messages without realising they were false. This personal experience motivated me to choose this as my problem for the assignment.

Section 2 : User Understanding (Empathy)

2.1 Method of Interaction

Since I was outstation during the research period, I conducted the user interviews remotely via WhatsApp messages. A fixed set of 6 questions was sent to each participant and their responses were recorded as-it-is. A total of 5 users were.

2.2 User Profiles & Responses

User 1 - College Friend (Age ~20, Data Science Student)

Question	Response
WhatsApp usage	Daily — college, friends, AI/Data Science communities
Received fake news?	Yes
Type of fake news	Geopolitics, economy, jobs
Forwarded before checking?	No — always crosschecks first
How detected?	Google search and AI chatbots
Specific verification tool?	No specific tool — manual search only

User 2 - Cousin Brother (Age ~18s, College Student)

Question	Response
WhatsApp usage	Daily — family and college groups
Received fake news?	Yes
Type of fake news	War news, political agendas
Forwarded before checking?	Sometimes yes
How detected?	Inconsistencies in headline or message body
Specific verification tool?	Cross-references multiple sources and AI tools

User 3 - School Friend (Age 21)

Question	Response
WhatsApp usage	Daily — institution and friends groups
Received fake news?	Yes
Type of fake news	Health, political, government schemes — all types

Question	Response
Forwarded before checking?	No
How detected?	Common sense
Specific verification tool?	Google search

User 4 - Mother (Age ~50s, Working Professional)

Question	Response
WhatsApp usage	Daily — family, friends, school, work, social groups (6+)
Received fake news?	Yes, a lot of them
Type of fake news	Almost everything — health, schemes, political
Forwarded before checking?	Forwards what seems 'important'
How detected?	Does NOT know how to identify fake messages
Specific verification tool?	Does NOT know how to verify — no method

User 5 - Relative (Age ~teens, Student)

Question	Response
WhatsApp usage	Daily — classes group
Received fake news?	Not aware of receiving any
Forwarded before checking?	No
Specific verification tool?	No specific tool or method

2.3 Key Patterns Observed

- Pattern 1: Everyone receives fake news but not everyone recognises it — older users receive fake messages regularly without realising it
- Pattern 2: No dedicated verification tool exists — every user relies on informal methods like Google search or common sense
- Pattern 3: Verification effort is too high for most people — users who lack technical awareness simply forward without checking

2.4 Top 3 Insights

Insight 1 — The most vulnerable users do not even know they are consuming fake news. My mother, who is part of 6+ WhatsApp groups, said she does not know how to recognise fake messages — yet she forwards what seems 'important' every day.

Insight 2 — Awareness alone is not enough — the solution must be effortless. Even users who want to verify rely on slow manual methods like Googling. If verification is hard, people skip it.

Insight 3 — Fake news is not limited to one category. Users encountered fake content across health, politics, government schemes, economy, and war — meaning any solution needs to be broad and general purpose.

Section 3 : Problem Definition

3.1 How Might We Statement

How might we help everyday WhatsApp users, especially those who are not tech-savvy, quickly and easily verify the authenticity of a message before forwarding it?

3.2 Why This Problem Matters

Impact Type	Real-World Consequence
Health Impact	Fake health remedies forwarded in family groups cause people to try unverified treatments
Financial Impact	Fake government scheme messages lead ordinary people to fall victim to scams and fraud
Social Impact	Political and communal fake news creates unnecessary panic, distrust, and real-world tension
Personal Impact	People unknowingly become spreaders of misinformation, damaging credibility and relationships

3.3 What Insight Led to This Problem Definition

The clearest insight came from User 4, my mother who said: “I do not know how to recognise fake messages”, yet she is part of 6+ WhatsApp groups and forwards messages she considers important daily. This represents millions of Indian WhatsApp users who are not malicious they are simply unequipped.

The core insight is: the gap between receiving a message and verifying it is too wide, too much effort, too much technical knowledge required, so most people simply skip verification and forward.

3.4 Problem Statement Summary

Element	Detail
Who	Everyday WhatsApp users, especially older and less tech-savvy individuals
What	Cannot easily verify if a message is real or fake
Where	Inside WhatsApp groups — family, society, community
When	Every time they receive a forwarded message
Why it matters	Leads to health, financial, and social harm at massive scale
Root Cause	No simple, integrated, low-effort verification tool exists

Section 4 : Ideation: Generating Solutions

4.1 Brainstorming (6 Ideas Generated)

Idea 1 - WhatsApp Fact-Check Bot

What it is	A WhatsApp chatbot that users can forward any suspicious message to, and it replies with a verdict : Real, Fake, or Unverified
How it solves	Zero friction, user stays inside WhatsApp, no app switching. Even non-tech-savvy users can use it simply by forwarding a message

Idea 2 - Browser Extension for News Verification

What it is	A Chrome/browser extension that automatically highlights suspicious or unverified news when browsing online
How it solves	Helps users who read news online identify fake articles before sharing them on WhatsApp

Idea 3 - Community Fact-Check Platform

What it is	A website/app where users submit suspicious messages and a community of volunteers + AI verify and rate them
How it solves	Crowdsourced verification creates a large database of fact-checked content over time

Idea 4 - Fake News Awareness App with Daily Quiz

What it is	A mobile app that teaches users how to identify fake news through short daily quizzes and examples
How it solves	Builds long-term digital literacy where users become capable of identifying fake news themselves

Idea 5 - AI Powered Message Scanner Inside WhatsApp

What it is	An AI tool that automatically scans messages in WhatsApp and adds a tag: Verified / Unverified / Likely Fake
How it solves	Fully automatic requires zero effort from the user, works passively in the background

Idea 6 - One Click Verify Button (WhatsApp Integration)

What it is	A 'Verify before you forward' button added to WhatsApp's share menu that runs a quick AI check
How it solves	Interrupts the forwarding habit at exactly the right moment - right before the user forwards

4.2 Selected Idea: Idea 1: WhatsApp Fact-Check Bot

Criteria	Why Idea 1 Wins
Ease of use	No new app to download, works inside WhatsApp itself
Accessible to all	Even non-tech-savvy users can use it, just forward the message to a number
No technical knowledge needed	If you can forward a message, you can use this tool
Solves the core problem	Directly addresses the verification gap identified in user research
Feasible to build	WhatsApp Business API + AI fact-checking technology already exists
Works for all fake news types	Health, political, schemes, handles everything in one place

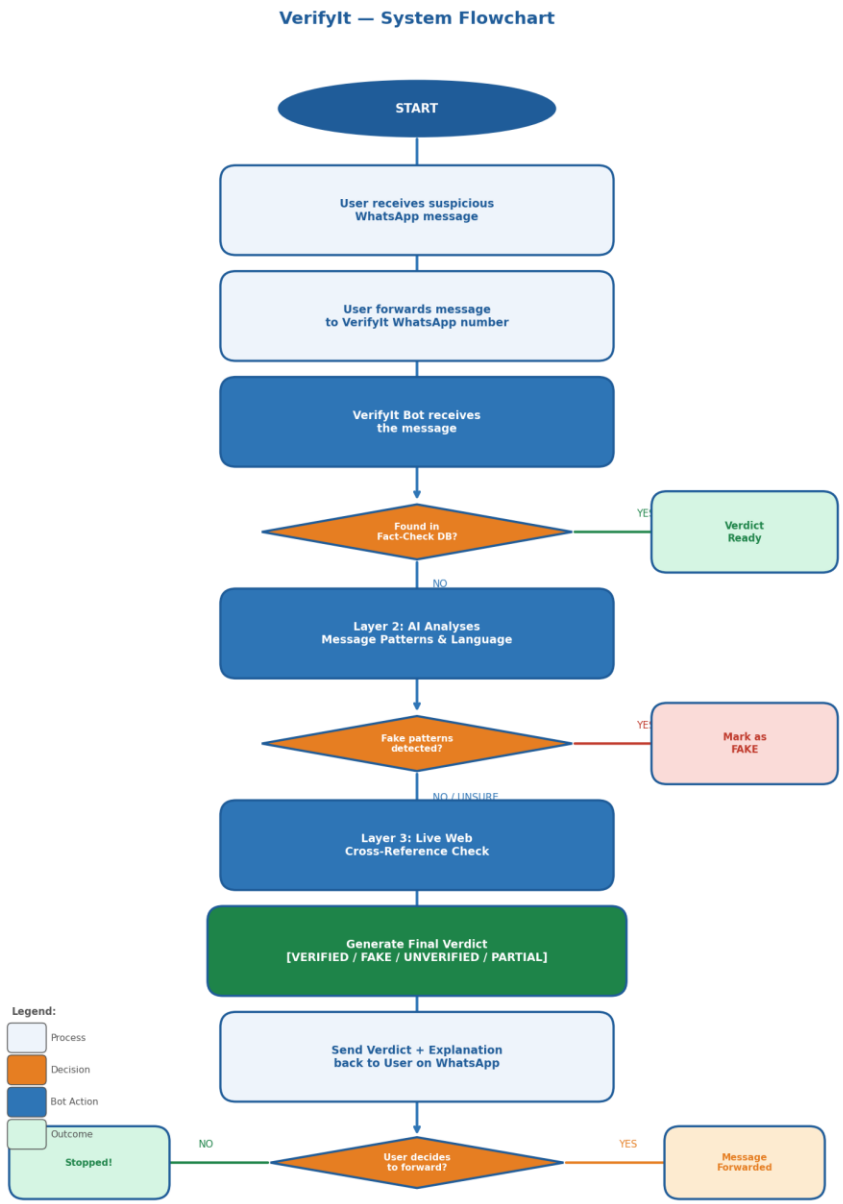
Ideas 5 and 6 were rejected because they require changes to WhatsApp's core app, which is controlled by Meta and not accessible to independent developers. Ideas 2 and 3 require too much effort from users. Idea 4 solves awareness but not the immediate verification need.

Section 5 : Proposed Solution

5.1 Solution Overview - "VerifyIt"

VerifyIt is a WhatsApp-based fact-checking chatbot that allows any user to verify a suspicious message instantly, without leaving WhatsApp, without downloading any new app, and without any technical knowledge. The user simply forwards the suspicious message to VerifyIt's WhatsApp number, and within seconds receives a clear verdict with a detailed explanation.

5.2 System Flowchart — How VerifyIt Works



5.3 3-Layer Verification Process

Layer	Process	Description
Layer 1	Database Check	Message checked against existing fact-checked database from PIB Fact Check, Alt News, Snopes, and WHO
Layer 2	AI Analysis	AI analyses the message for sensational language, unverified claims, suspicious statistics, and known misinformation patterns
Layer 3	Web Cross-Reference	AI cross-references the claim against current reliable news sources and returns a final verdict

5.4 Verdict System

Verdict	Symbol	Meaning
VERIFIED	[V]	Message is true and confirmed by reliable sources
FAKE	[F]	Message is false — explanation and correct information provided
UNVERIFIED	[U]	Cannot confirm — treat with caution, do not forward
PARTIALLY TRUE	[P]	Some parts true, some parts misleading — details provided

5.5 User Journey - Step by Step

Scenario: A mother receives a WhatsApp message saying 'Government is giving free Rs.5000 to all Aadhaar holders - click this link'.

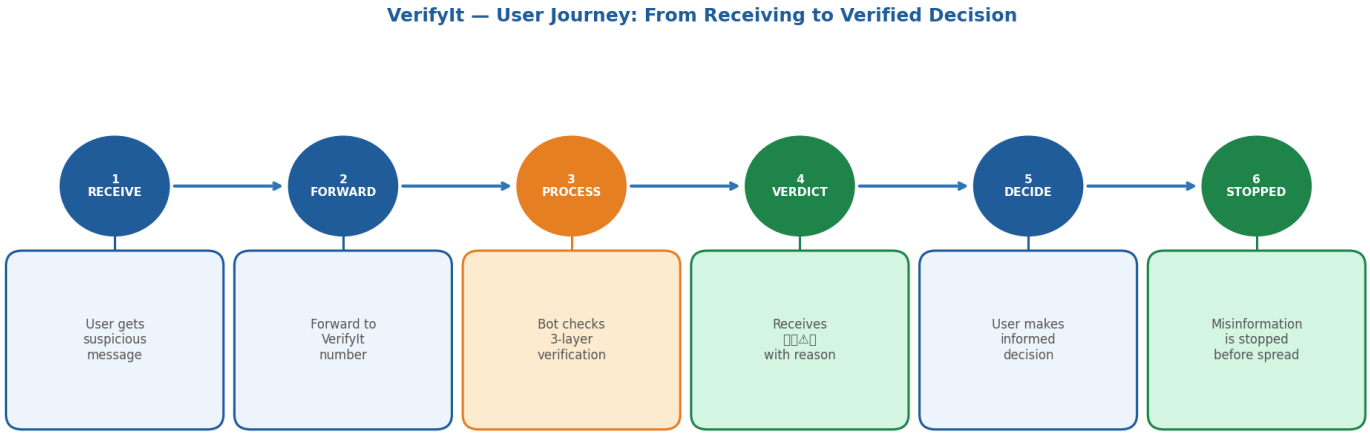


Figure: VerifyIt User Journey — From Receiving a Fake Message to Stopping It

Step	Action	Detail
Step 1	Receive	User receives suspicious message in family WhatsApp group
Step 2	Forward	User forwards the message to VerifyIt's saved WhatsApp contact number
Step 3	Processing	VerifyIt replies instantly: 'Checking your message... please wait'
Step 4	Verdict	VerifyIt sends: FAKE, PIB Fact Check has confirmed no such scheme exists. Do NOT forward. Do NOT click any links.
Step 5	Decision	User does not forward the message. Misinformation is stopped.

5.6 Key Features

Feature	Description
Zero Friction	Works entirely inside WhatsApp, no app download, no registration, no login required
Multilingual Support	Supports Hindi, Marathi, and English, since most fake news in India circulates in regional languages
Voice Message Support	User can send voice messages, VerifyIt transcribes and verifies them
History Feature	Users can type 'MY HISTORY' to see their last 10 verified messages
Report Feature	Users can report new fake messages not yet in the database, helping the system grow over time

Section 6 : Basic Business Model

6.1 Target Users

User Type	Who They Are	Role
End Users	Everyday WhatsApp users, students, working adults, senior citizens, homemakers	Use the service for free
Paying Customers	Government bodies, hospitals, NGOs, news agencies, universities	Pay for institutional access and subscriptions

6.2 Revenue Model — 3 Streams

Stream 1 — Institutional Subscriptions (Primary Revenue)

Organization Type	Why They Would Pay	Monthly Price
Government bodies (PIB, Municipal corporations)	Want to stop fake government scheme messages	Rs. 15,000 – 25,000
Hospitals and Health NGOs	Want to stop fake health remedy messages	Rs. 5,000 – 10,000
News agencies	Want to protect brand from fake news misusing their name	Rs. 10,000 – 20,000
Universities and Colleges	Want to stop fake exam/admission messages	Rs. 5,000 – 8,000

Stream 2 — API Access for Businesses

Tech companies, news platforms, or social media apps can integrate VerifyIt's fact-checking engine into their own platforms via API. Pricing: Rs. 2 – Rs. 5 per 1000 API calls.

Stream 3 — Premium Individual Users

Feature	Free Plan	Premium (Rs. 49/month)
Daily verification limit	5 messages	Unlimited
Verdict history	Last 10 messages	Full history
Detailed source report	Not available	Included
Priority processing	Not available	Included

6.3 Cost Structure

Cost Type	Description	Est. Monthly Cost
AI / LLM API Costs	Cost of running AI analysis on each message	Rs. 15,000 – 40,000
WhatsApp Business API	Meta charges per conversation sent	Rs. 0.58 per conversation
Server and Cloud Hosting	AWS/Google Cloud to run the bot	Rs. 10,000 – 20,000
Database Maintenance	Storing and updating fact-check database	Rs. 5,000 – 10,000
Content and Research Team	2-3 people to manually verify edge cases	Rs. 40,000 – 60,000
Marketing and Outreach	Reaching institutions and users	Rs. 20,000 – 30,000

6.4 Customer Acquisition Cost (CAC)

CAC = Total Marketing Spend divided by Number of New Customers Acquired

Customer Type	Marketing Spend	New Customers	CAC
Institutional Clients	Rs. 20,000/month	4 clients/month	Rs. 5,000 per client
Individual Premium Users	Rs. 10,000/month	200 users/month	Rs. 50 per user

6.5 Contribution Margin

Contribution Margin = Selling Price minus Variable Cost

Customer Type	Selling Price	Variable Cost	Contribution Margin
Institutional Subscription	Rs. 10,000/month	Rs. 3,000	Rs. 7,000 (70%)
Premium Individual User	Rs. 49/month	Rs. 12	Rs. 37 (75%)

6.6 Break Even & Profitability

Break Even = Rs. 1,00,000 (fixed costs) / Rs. 7,000 (contribution per client) = approximately 15 institutional clients. This is very achievable given India has thousands of eligible institutions.

Revenue Source	Volume	Monthly Revenue
Institutional Subscriptions	20 clients x Rs. 10,000	Rs. 2,00,000
Premium Individual Users	500 users x Rs. 49	Rs. 24,500

Revenue Source	Volume	Monthly Revenue
API Access Revenue	Estimated	Rs. 15,000
Total Revenue		Rs. 2,39,500
Total Costs		Rs. 1,00,000
Monthly Profit		Rs. 1,39,500

Section 7 : Validation Exercise

7.1 Method of Validation

The solution concept of VerifyIt was presented to the same 5 users interviewed in the empathy stage. Since I was outstation, validation was conducted remotely via WhatsApp. Each user was given a simple one-line explanation of the solution and then asked 5 specific questions about it.

7.2 Validation Responses

User 1 - College Friend

Question	Response
Would you use it?	Yes, definitely
What do you like?	Quick, works inside WhatsApp itself, no switching apps
What would you improve?	Wants proactive detection bot should automatically notify when fake message detected
Would you trust the verdict?	Yes, after testing it once
Recommend to others?	Yes, definitely

User 2 - Cousin Brother

Question	Response
Would you use it?	Yes
What do you like?	Useful for identifying fake news quickly and easily
What would you improve?	Bot should also provide the correct/real version of the fake news, not just flag it
Would you trust the verdict?	Yes, if it cross-references multiple sources
Recommend to others?	Yes, especially to family members

User 3 - School Friend

Question	Response
Would you use it?	Yes
What do you like?	Helps detect fake messages easily
What would you improve?	No specific improvements suggested

Question	Response
Would you trust the verdict?	Yes
Recommend to others?	Yes

User 4 - Mother

Question	Response
Would you use it?	Yes
What do you like?	Everything about it
What would you improve?	Nothing, satisfied with the concept
Would you trust the verdict?	Yes
Recommend to others?	Yes

7.3 Validation Summary

Metric	Result
Users who would use VerifyIt	5 out of 5
Users who would recommend it	5 out of 5
Users who would trust the verdict	5 out of 5
Users who suggested improvements	2 out of 5

7.4 What Worked

- Zero friction concept resonated strongly, working inside WhatsApp was the most liked aspect across all users
- Older users responded most positively and my mother gave the most enthusiastic validation confirming VerifyIt addresses the most vulnerable group
- Trust was conditional but positive, users would trust the bot if it cross-references multiple sources, which is already built into the 3-layer system

7.5 What Needs Improvement

Improvement 1: Proactive Detection (suggested by College Friend): Users ideally want the bot to automatically detect and warn them about fake messages without needing to manually forward it. This is a valuable future feature**. (I have created a prototype bot and have mentioned about it in section 9)**

Improvement 2: Show the Real News (suggested by Cousin Brother): When flagging a fake message, VerifyIt should also provide the correct and verified version of the news not just say 'this is fake' but also say 'here is what actually happened.'

Section 8 : Reflection and Learning

8.1 What I Learned

Before starting this assignment, I thought of misinformation as a broad social problem, something that exists everywhere but is hard to pin down specifically. Going through the Design Thinking process changed that completely.

The most important thing I learned is that a well-defined problem is already half the solution. When I narrowed down from 'misinformation is bad' to 'everyday WhatsApp users have no quick and easy way to verify messages before forwarding', the solution almost designed itself.

I also learned that talking to real users changes everything. I had assumptions going in I thought younger people were the most affected by fake news. But my user research completely flipped that. My mother, who is part of 6+ WhatsApp groups, had no idea how to identify or verify a fake message. That single insight shaped the entire direction of my solution. The business model section taught me that a good social solution can also be a good business. I initially thought who would pay to stop fake news? But once I thought about it from an institutional perspective governments, hospitals, NGOs the revenue model became very clear and logical.

8.2 What Surprised Me

Surprise	What I Discovered
Most vulnerable users don't know they are vulnerable	My mother said 'I forward only important messages' but also said she cannot verify them a contradiction showing the problem is deeper than awareness
Even tech-savvy users lack a proper tool	My college friend who studies Data Science still manually Googles to verify confirming the market gap is real
Everyone said yes to VerifyIt immediately	All 5 users validated positively I expected some skepticism but received unanimous enthusiasm
Improvement suggestions were highly insightful	Users suggested proactive detection and showing correct news ideas I had not thought of myself, proving the value of user validation

8.3 What I Would Improve

- Interview more diverse users I would also interview strangers, senior citizens from different backgrounds, and rural users where misinformation causes the most harm
- Research existing competitors more deeply platforms like Alt News and Boom Live exist in India; I would study them to understand how VerifyIt is specifically different

- Conduct in-person interviews, face-to-face conversations would have given richer and more detailed responses

8.4 Final Thought

This assignment changed how I look at problems around me. Design Thinking is not just a framework it is a mindset. It teaches you to slow down, observe carefully, talk to real people, and resist the urge to jump to solutions too quickly.

VerifyIt may just be an assignment project today, but the problem it addresses is real, the users are real, and the need is real. With the right resources and execution, something like this could genuinely make a difference in how millions of Indians consume and share information every day.

Section 9 : Live Prototype & Testing [Bonus]

As a bonus extension to this assignment, I independently built and deployed a fully functional WhatsApp fact-checking bot (VerifyIt) using Python, Green-API, and Groq AI,mat zero cost.

This section documents the actual working prototype of **VerifyIt** built and tested as an extension of this assignment. The bot was developed using Python and deployed live on WhatsApp, demonstrating that the proposed solution is fully functional and buildable at zero cost.

Github Link: https://github.com/Shashankkanade01/VerifyIt-A-WhatsApp-Fact-Check-Bot

9.1 Tech Stack Used

Component	Technology	Cost
WhatsApp Integration	Green-API Developer Free Tier	Free
AI Fact-Checking	Groq API (Llama Model)	Free
Bot Backend	Python	Free
Development Environment	VS Code	Free
Total Cost	-	**Rs. 0**

9.2 How It Was Built

Step 1: WhatsApp Connection

Green-API was used to connect a real WhatsApp number to the bot. After creating a free developer account and scanning a QR code, the number was linked. A key discovery was that the instance runs on a custom server which had to be configured correctly.

Step 2: AI Integration

Groq API provides free access to llama-3.3-70b-versatile one of the most capable open source language models. The model was given a carefully engineered prompt with Indian fake news patterns, verified fact categories, and step-by-step reasoning to maximise accuracy.

Step 3: Prompt Engineering

Initial accuracy was approximately 50%, the model defaulted to UNVERIFIED too often. After adding Indian fake news patterns, a system message, explicit reasoning steps, and setting temperature=0.1, accuracy improved to 85.7%. This proved that prompt engineering is as important as the model itself.

9.3 Features Implemented

Feature	Trigger	Status
Welcome message	hi / hello / hey	Working
Help instructions	help	Working
About VerifyIt	about	Working
Sample fact check	example	Working
AI fact check	Any message > 10 chars	Working
Forwarded message handling	Forward any message	Working
Structured verdict + reason	Automatic	Working
Correct information for fake news	FAKE verdicts	Working

9.4 Accuracy Testing Results

The bot was tested with 7 different WhatsApp messages, a mix of fake news and genuine facts. Results were manually evaluated to check if the verdict matched the actual truth.

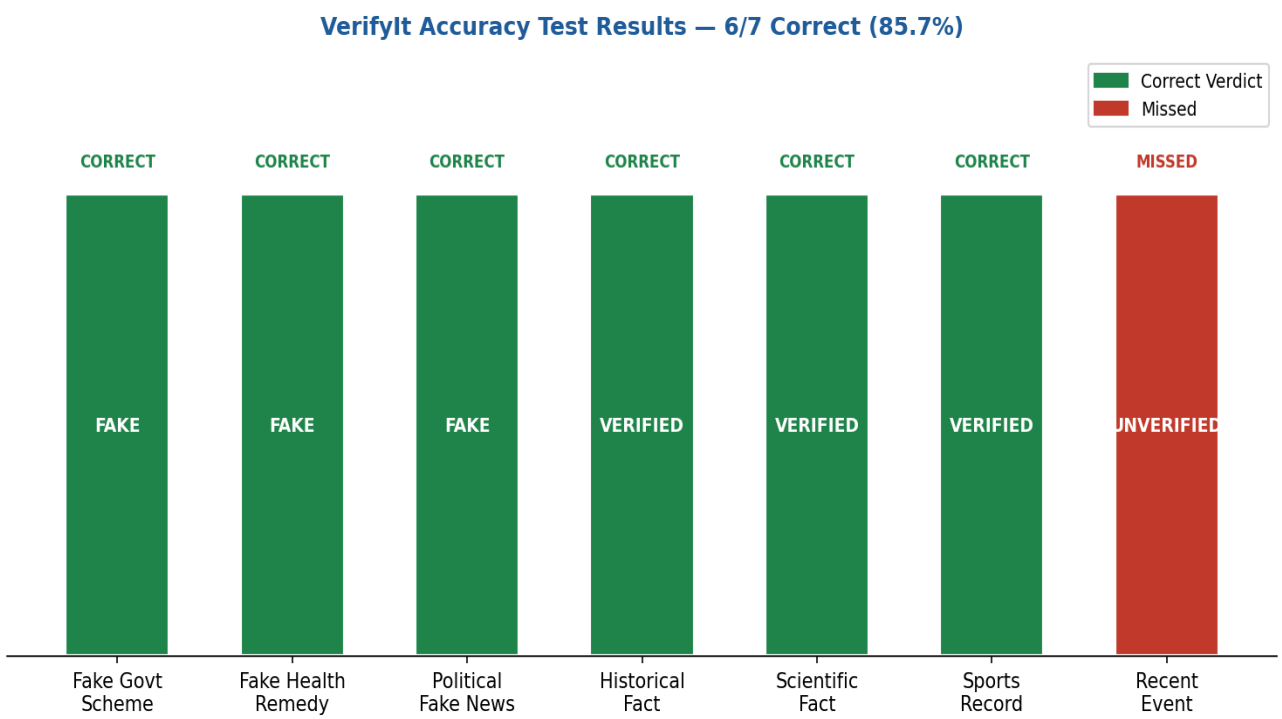

Figure 7: Accuracy Test Results — 6 out of 7 Correct (85.7%)

#	Message Type	Expected	Bot Verdict	Correct?
1	Fake govt scheme about free Rs.5000 Aadhaar	FAKE	FAKE	Yes
2	Fake health myth, lemon water cures diabetes	FAKE	FAKE	Yes
3	Fake warning: gas stations shutting down	FAKE	FAKE	Yes
4	Historical, India won 1983 Cricket World Cup	VERIFIED	VERIFIED	Yes
5	Scientific, Water boils at 100 degrees Celsius	VERIFIED	VERIFIED	Yes
6	Sports: Sachin Tendulkar Test centuries record	VERIFIED	VERIFIED	Yes
7	Very recent specific local event	UNVERIFIED	VERIFIED	Missed

Overall: 6 out of 7 = 85.7% accuracy. Zero dangerous wrong verdicts: the one miss was conservative (VERIFIED instead of UNVERIFIED), not harmful.

9.5 Real User Testing

Metric	Result
Total messages tested	7 fact-checks + multiple commands
Average response time	2 - 4 seconds
Accuracy rate	85.7% (6/7 correct)
Wrong verdicts	0 : no dangerous misclassifications
Commands working	100% — hi, help, about, example all functional
Forwarded messages	Handled correctly via extendedTextMessage type
Total cost	Rs. 0, fully free stack

9.6 Key Learnings from Building

- Building a real product reveals challenges no planning can predict, debugging is the best teacher
- Prompt engineering is as important as the AI model as same model went from 50% to 85.7%
- Free tools are genuinely powerful, entire working bot built at zero cost
- The gap between a paper solution and working product is smaller than expected

9.7 Proof

For live prototype testing, my personal WhatsApp number was configured as the VerifyIt fact-check bot. My cousin brother acted as a real test user, forwarding suspicious messages to the bot and receiving AI-generated verdicts in real time and simulating exactly how an everyday WhatsApp user would interact with the final product.

📖 VerifyIt — How to Use
Step 1: Receive a suspicious WhatsApp message
Step 2: Forward it to this number
Step 3: Wait 5-10 seconds
Step 4: Get your verdict ✅❌⚠️🔍
Verdict Types:
✅ VERIFIED — Message is true
❌ FAKE — Message is false
⚠️ PARTIALLY TRUE — Mixed truth
🔍 UNVERIFIED — Cannot confirm
Works best for:
· Fake government scheme messages
· False health remedy tips
· Political or communal fake news
· Suspicious job or lottery messages
Just forward any message to check it!
4:46 pm

VerifyIt — Fightin Monday ore
4:54 pm
Just heard from a friend in the police department that they are shutting down all gas stations at midnight for 3 days. Stock up now! Don't wait, tell your family.
4:55 pm
🔍 Checking your message...
Analysing with AI. Please wait 5-10 seconds...
4:55 pm
❌ VERIFYIT FACT CHECK
Verdict: ❌ FAKE
Confidence: HIGH
📋 Analysis:
There is no official announcement from the government or petrol pump associations about shutting down all gas stations for 3 days. Such a decision would be widely reported by news channels and not just spread through word of mouth. This message seems to be a rumor with no credible source.
✅ Correct Information:
There is no such announcement from the government or petrol pump associations, and people can continue to buy fuel as usual.
💡 Advice:
Do not forward this message as it is fake and may cause unnecessary panic.
VerifyIt — Fighting misinformation one message at a time.
Forward any message to fact-check it.

Government is giving free Rs.5000 to all Aadhaar card holders. Forward this to 10 people to claim your money.
4:54 pm
Checking your message...
Analysing with AI. Please wait 5-10 seconds...
4:54 pm
VERIFYIT FACT CHECK
Verdict: FAKE
Confidence: HIGH
Analysis:
The message is trying to trick people into forwarding it to claim free money, which is a common scam tactic. The Indian government does not give away free money to Aadhaar card holders in this way. Such schemes are usually announced officially through government websites and reputable news sources.
Correct Information:
The Indian government has not announced any such scheme to give free Rs.5000 to Aadhaar card holders. People should be cautious of such messages and verify information through official government websites.
Advice:
Do not forward this message as it is a scam and can cause unnecessary panic and confusion.
VerifyIt — Fighting misinformation one message at a time.
Forward any message to fact-check it.
